                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKRZp5661133 activity. The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method comprising comparing an expression positie of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially

unaupervised clustering analysis of gene expression profiles in PBMCs of a population of patients who have the solid tumour, and where the apopulation of patients who have the solid tumour, and where the case of patients has a first clinical outcome, and the first class of patients has a second clinical outcome, and the majority of the second class of patients has a second clinical outcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at tumour, (ii) at least once reference expression profile of the gene, (iii) a program capable of comparing the expression profile to the reference expression profile, and (iv) a processor capable of executing the captession profile, and (iv) a processor capable of executing the expression profile, and (iv) a processor capable of executing the captession profile, and (iv) a processor capable of executing the expression levels of the gene in peripheral blood monourclear cells of patients who have the solid tumour correlate with clinical outcomes of the patients and ancleic acid or protein array comprising concentrated probes for solid tumour prognosis genes where each of the patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as solid tumours. This sequence tepresents a solid tumours prognosis gene of the method, system, and array are useful for prognosing and treating cutcome, and the second class of patients as a second classes of the invention. Note: The sequence tepresents a solid tumours: This sequence represents a solid tumours. This sequence represents a solid tumours prognosis; gene of the invention. Note: The sequence data for this patent did not form at the invention. Note: The sequence data for this patent did not form at the invention will be second class of patients has a second class of the printed specification, but was obtained in electronic format
expressed in peripheral blood mononuclear cells (PBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes of patients have the solid tumour, and each of the first and second classes is a subcluster formed by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Canine; TAA; tumour-associated antigen; anti-tumour; cytostatic;

```

The present sequence encodes the canine 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

```
tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the human or murine 5T4 gene sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown
carcinomas but has a highly restricted expression pattern in normal adult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast

in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in creased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating a modulatory compound identified. The methods are useful contracting lung cancer, such as small cell lung cancer, non-small cell contracting lung cancer, cher benign or precancerous leations, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences the statest sequences compounds that modulate lung cancer-associated polynucleotides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; gene therapy, vaccine, ovarian cancer; diagnosis, post-operative chemotherapy; radiation therapy; tumour prognosis; pre-cancerous lesion detection; ds; gene.

The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, electing mide of therapy, detection of pre-cancerous lesions, determining tumour prognosis, early detection of pre-cancerous lesions,
                       Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease;

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; p53 pathway; Leucine rich repeat capricious related protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          31-MAY-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10-JUL-2001;
                                      19-SEP-2002
 The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antinflammatory; cardiant; haemostatic; neuroprotective; anorectic; nootropic; immunosuppressive; osteopathic; antiparkinsonian; cancer; antinfertility; carebroprotective; gene therapy; NOVX; NOV; Ertility; metabolic disorder; diabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; cardiovascular disorder; bronchial asthma, dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopoiesis; wound healing; angiogenesis; ds.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases uch as metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases and aschma, AIDS, dyslipidemia, metabolic disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with obesity, metabolic syndrome X or wasting disorders associated with obesity, metabolic syndrome X or wasting coling sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the concofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell compositions in animals, proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracte plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The cells may then be subject to biochemical or genetic sampling used for teeting foetal abnormalities, or to determine the sex of the foetus(es).

The present sequence encodes feline 574 protein Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat. ```
The invention relates to a Major Histocompatibility Complex (MHC) class of II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or mucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, TAA, tumour-associated antigen, anti-tumour, cytostatic,

```
Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.
The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune
                                                                                                                                                                                                                                                       Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 response, preferably CTL or an antibody response in a subject

The specification describes the use of a single chain antibody (SCFV), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the pervention and treatment of a disease condition. The SCFV antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. Including arthribody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system disorders including Parkinson's disease, periodontal diseases, cardiopulmonary diseases, ardiovascular diseases, gastrointestinal disorders, infections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce SCFV of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cDNA encoding canine oncofoetal leucine-rich glycoprotein, 5T4.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the professed in colontal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell conficients in factorions, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in disgnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, issues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The isolating foetal may then be subject to biochemical or genetic mapping used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes canine 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1263 BP; 200 A; 469 C; 377 G; 217 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TTAT. The TAT 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been included were incoulated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit en immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                          Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88; gene; human; signal transducer and activator of transcription 6; STAT6; immunogen; STAT6 activation; allergy; inflammation; autodimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosuus; asthma; allergic rhinitis; systemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or succeptibility to a disease related to expression or activity of the compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant composition, antibodies and antisense molecules are useful composition. Composition, antibodies and antisense molecules are useful composition composition, authority and antisense molecules are useful composition diseases, inflammation, autoimmune diseases, diabetes, allergic diseases, inflammation, autoimmune diseases, diabetes, allergic disease associated with STAT6 activation and/or prevention for treating disease associated with STAT6 activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthritis, oscheamitis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activation or inhibition of STAT6. The present sequence represents a cuivation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; gene; human; signal transducer and activator of transcription 6; STAT6; immunogen; STAT6 activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.
                                                                                               New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human cDNA encoding protein that promotes STAT6 activation #62.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administaring the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as altergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention for treating diseases. Compositions are also useful in rheumatoid attritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activity. The protein or nucleic acid is effectively useful for screening compounds for treating and appreventing disease associated with excessive compounds for treating and preventing disease associated with excessive activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activation or inhibition of STAT6. The present sequence represents a human cDNA encoding a protein which promotes STAT6 activation.
                                                                                                                                                                                                                                                                          signal transducer and activator of transcription 6 activation noting purified protein, for diagnosing and treating disease ociated with activation/inhibition of transcription factor e.g.

The invention comprises 744 novel mouse DNA sequences (genes). The DNA sequences of the invention are useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischaemic heart disease, thrombosis, mamune disorders, bacterial disorders and viral disorders. The present nucleic acid represents a mouse DNA sequence of the invention. NOTE: The present DNA sequence is not shown in the specification, but has been retrieved from the WIPO website.

soybean

```
The invention relates to nucleic acid molecules from regions of the soybean genome which are associated with soybean cyst nematode (SCN) resistance. The nucleic acids are used to transform plants, and can produce soybean plants having an rhg1 or an Rhg4 SCN resistant allele. The nucleic acids can be used for investigating rhg1 or Rhg4 haplotypes of soybean plants and for introgressing SCN resistance or partial SCN resistance into soybean plants. They can also be used in plant breeding programmes. The invention also relates to proteins encoded by such nucleic acid molecules, as well as antibodies capable of recognising these proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 myotonic muscular dystrophy; acanthosis; nigricans; retinopathy; nephropathy; artherosclerosis; peripheral arterial disease; cancer; adenocarcinoma; leukaemia; breast cancer; prostate cancer; colon cancer; ovarian cancer; autolmmune disease; inflammation; immunodeficiency.

The nucleic acids are used to transform plants, and can produce soybean plants having an rhgl or an Rhg4 SCN resistant allele. The nucleic acids can be used for investigating rhg1 or Rhg4 haplotypes of soybean plants and for investigating rhg1 or Rhg4 haplotypes of soybean plants. They can also be used in plant breeding programmes. The invention also relates to proteins encoded by such nucleic acid molecules, as well as antibodies capable of recognising these proteins. The present sequence is a nucleic acid molecule provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 335913 BP; 114579 A; 53403 C; 53026 G; 114905 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                  New purified nucleic acid for producing a soybean plant having soybean cyst nematode resistance and for use in plant breeding programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Soybean, antihelmintic; gene therapy; soybean cyst nematode; SCN; SCN resistant allele; plant breeding; 240017 region G3; 318013 region A3; 515002 region G2; ds.

The invention relates to an isolated Pleckstrin homology domain interacting protein (PHIP) that recruits proteins of the insulin receptor substrate (TRS) family, and signal transducer and activator of transcription (STAT) transcription factors, to receptors that interact with and phosphorylate the proteins and STAT transcription factors, the nucleic acid encoding PHIP (nPHIP), a nucleic acid which binds to nPHIP or regions of it, analogues, fragments or allelic variants of PHIP or newtons and inferentiation-related protein (NDRP) nucleic acid sequence infiferentiation-related protein (NDRP) nucleic acid sequence or neuronal differentiation-related protein (NDRP) nucleic acid sequence or its exons as given in the specification, expression vectors and host calls approach an already expressing PHIP The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal not already expressing PHIP. The nucleic acids, and a transgenic animal and already expressing PHIP.
                                                                                                                                                         Novel Pleckstrin homology domain interacting protein recruiting proteins of insulin receptor substrate family, and signal transducer and activator of transcription factors to their receptors, useful to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer, colon cancer, ovarian cancer and many others given in the specification, autoimmune disease, inflammation and immunodeficitiency. The protein is also useful for discovering or testing compounds which may be either enhancers or inhibitors of PHIP function. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               associated with an insulin receptor (e.g. diabetes mellitus type 2, hyperglycaemia, myotonic muscular dystrophy, acanthosis, nigricans, retinopathy, nephropathy, artherosclerosis, peripheral arterial disease)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 140036 BP; 48500 A; 25843 C; 22499 G; 43194 T; 0 U; 0 Other;

lactation or muscle and fat deposition designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a tissue, where hybridisation between the marker nucleic acid and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          detecting the level or pattern of the complementary nucleic acid, where the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid; where the detection of the complementary nucleic acid is predictive of the determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 15112 bovine LMFD EST (expressed sequence tag) nucleic acids, Note: The
                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a purified nucleic acid molecule associated with

                                                                                                                                                                                                                                                                                                                                           The invention relates to 9672 polynucleotides (ACL53866-ACL63537) which are differentially expressed in colon cancer cells. The invention also crelates to vectors and host cells comprising a differentially expressed polynucleotide of the invention; a method for detecting a cancerous cell by detection of a gene product of the polynucleotides; a method of treating a gene product of the polynucleotides; a method of treating an individual with cancer by administration of a modulator of a gene product of the polynucleotides; and an isolated antibody that specifically binds to a polypeptide encoded by one of the 9672 polynucleotides responsed in a polynectides; and methods are useful for the detection of cancerous cells; for the diagnosis, prognosis and management of cancer; for the control of agents that modulate the phenotype of cancerous cells; for the identification of therapeutic targets for cancer chemotherapy; cond for the treatment of cancer, especially colon cancer and metastasized colon cancer, but also breast or pancreatic cancer. The polynucleotides are also useful as a source of probes or primers for use in diagnostic methods. The differentially expressed polynucleotides or their encoded proteins can additionally be used as vaccines to modulate primary immune responses for the prevention or treatment of cancer. The present sequence corresponse for the preventially expressed polynucleotide which is differentially expressed to concurr for mean of the printed specification, but was obtained in colon cancer. Note: The sequence data for this patent did concern for the preventially and concern the sequence data for this patent did colon cancer.
                                                                                                                                                                                                                                                            New isolated polynucleotides, which are differentially expressed in colon cancer cell, useful for treating cancer, e.g. colon cancer, breast cancer, or pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 505 BP; 68 A; 202 C; 149 G; 85 T; 0 U; 1 Other;

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, issues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The solating foetal about form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.

The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope string comprising the 5T4 epitope; a nucleic acid sequence encoding the 5T4 epitope or a polyepitope string of the 5T4 epitope or a polyepitope string of the 5T4 epitope or a cell; a cell pulsed with the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope or preventing a disease or peptising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising the presence of the 5T4 epitope or its encoding comprising the 5T4 epitope and/its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 5T4 epitope in conjunction with an MHC class or molecule. The 5T4 epitope or its encoding nucleic acid and the vector system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for diagnosing or monitoring the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           major histocompatibility complex class I peptide epitopes from human tumor-associated antigen, useful for preventing and/or treating a

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the felline 5T4 protein.
                                                                                                                    gene; ds; feline; Major Histocompatibility Complex class II; MHC; epitope; 5T4 antigen; vaccine; T-cell; cytostatic; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metaerasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen is sequence to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                          Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

The specification describes the use of a single chain antibody (ScFv), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The ScFv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system disorders including Parkinson's disease, periodontal diseases, cardiopulmonary diseases, cardiovascular diseases, gastrointestinal disorders, infections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce ScFv of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the profortuleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used in disquastic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, issues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The calsation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel canine or feline 574 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.

Rattus norvegicus (Norway rat)
                                                                                                                                                                                                                                                                                                             The BAC Library has been constructed by Pieter de Jong and coworkers (http://www.chori.org) from male GSTBL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at http://www.chori.org
If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.
                                                                                                                                   Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. ```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e. phred quality as 230); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The stanishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is

On Nov 19, 2002 this sequence version replaced gi:23265004.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole contigs within a contigs caffold that consist entirely of whole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (19-UUL-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             end sequences and whole genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    shotgun sequence only contigs will be indicated in the feature table.

On Nov 20, 2002 this sequence version replaced gi:22857070.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgum sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the facture table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

unordered pieces.
                                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                    Assembly program: Phrap; version 0.990329
Consensus quality: 228642 bases at least Q40

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (08-AUG-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is
individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig sacifold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

Submitted (19-SEP-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, Tr 77030, USA On Sep 19, 2002 this sequence version replaced gi:21909333. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequening reads assembled using A.Las (http://www.hgsc.bcm.tmc.edu/projects/rat/). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               206729: contig of 206729 bp in length 206829: gap of unknown length 224842: contig of 17913 bp in length 224842: gap of unknown length 226456: contig of 1514 bp in length 226456: gap of unknown length 228414: contig of 1958 bp in length.

The RPCI-24 BAC Library has been constructed by Pieter de Jong and coworkers (http://www.chori.org) from male CS7BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren,
Department of Genetics, Washington University, St. Louis MO. For
additional information about the map position of this sequence, see
                                                                                                                                                            NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                             This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is the entire insert of the clone. This clone is overlapped by AC121871.

(TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to mestrais in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
                                                                                Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           systemic lupus erythematosus; sepsis; asthma; allergic rhinitis;
ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.
                                                                                                                                                                    The present sequence encodes the mouse 574 tumour-associated antigen
                                                                                                                                                                                                                                                                                                                        the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ss; gene; human; signal transducer and activator of transcription STAT6; immunogen; STAT6 activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; th hyperactive disease; rheumatoid arthritis; osteoarthritis;

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune disease, diabetes, chyperlipidaemia, infections disease associated with STAT6 activation and/or prevention of the treating disease. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive decipation of STAT6. The present sequence represents a decipation of STAT6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; gene; human; signal transducer and activator of transcription 6; STAT6; immunogen; STAT6 activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; albS. ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.
                                                                                                                                      purified protein, for diagnosing and treating disease with activation/inhibition of transcription factor e.g.
                                                                                                               and activator of transcription 6 activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human cDNA encoding protein that promotes STAT6 activation #62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human cDNA encoding a protein which promotes STAT6 activation.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STATS). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The mucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STATS activation. A transformant composition. Some protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STATS activation such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STATG activation and/or prevention of Th1 hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepsitis and AIDS. The protein has efficient promoting STATG activity. The protein nor nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive activation or inhibition of STATG. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                    promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g.
                                                                                                                                                                                                                                                                                                                                                                                            signal transducer and activator of transcription 6 activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               numan cDNA encoding a protein which promotes STAT6 activation.

WPI; 2004-431966/40.

New mouse nucleic acid molecules and polypeptides, useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischemic heart disease or thrombosis.

Claim 1; SEQ ID NO 612; 263pp; English.

The invention comprises 744 novel mouse DNA sequences (genes). The DNA sequences of the invention are useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischaemic heart disease, thrombosis, immune disorders, bacterial disorders and viral disorders. The present nucleic acid represents a mouse DNA sequence of the invention. NOTE: The present DNA sequence is not shown in the specification, but has been retrieved from the WIPO website.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are if in the call having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non-translated sequence that functions in the call to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and cissue comprising a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating amarker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for geneme mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constant sequence used sequence tag) nucleic acids in the present sequence as one of the constant sequence as one applied in a bovine and analysis, cattle constant sequence as one as the constant sequence as one of the constant sequence as one as the constant sequence as one as and an analysis of the constant sequence as one as and an analysis of the constant sequence as one as and an analysis of the constant sequence as one as and an analysis of the constant sequence as one as an analysis of the constant sequence as and an analysis of the constant sequen
                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 343 BP; 40 A; 146 C; 108 G; 49 T; 0 U; 0 Other;

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 514, and the concofoetal leucine-rich glycoproteins known as 514, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell concerning to the invention and or treatment of tumours or other diseases associated with cell concerning to preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in disquestic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, this seues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The contain and in part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

```

The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 5T4 antigen. The invention further provides a polypelicope string comprising the 5T4 epitope; a nucleic acid compression of the 5T4 epitope; a vector system capable of delivering the 5T4 epitope; and the 5T4 epitope string of the 5T4 epitope acid to a cell julsed with the 5T4 epitope, a polypelitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease of a mathod for treating and/or preventing a disease of a mathod for treating and/or preventing a disease of a specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 5T4 epitope and/its encoding nucleic acid; a method comprising the 5T4 epitope has cytostatic activity. The vaccine inclear acid in a subject; and a T cell line or clone capable of system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for disquasing or system or cell is useful in the prevention and/or treatment of a disease, presence of the 5T4 epitope or its encoding nucleic acid and the vector system or cell is useful in the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or treating the treating and/or treating the treating treating the treating the treating treating treating treating treati

Disclosure; Page 49; 63pp; English.

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.
